Assignment no : 03

① Perform the following operations using stack. Assume the size of the stack is 5 and having a value of 22, 55, 33, 66, 88 in the stack from 0 position to size-1. Now perform the following operations

1) Invert the elements in the stack, 2) Pop[], 3) Pop[], 3) Pop[], 4) Push[90], 5) Push[36], 6) Push[11], 7) Push[88], 8) Pop[], 9) Pop[].

Draw the diagram of stack and illustrate the above operations and identify where the top is?

A, Size of the stack: 5

Elements in stack (from bottom to top): 22, 55, 33, 66, 88

Top of stack: 88

Operations:

1) Invert the elements in the stack:

• The operation will reverse the order of elements in the stack.

• After inversion, the stack will look like:

2) Pop():

- Remove the top element (22).

55	← TOP
33	
66	
88	

3) Pop():

- Remove the top element (55).

33	← TOP
66	
88	

4) Pop():

- Remove the top element (33).

Stack after Pop:

66	← TOP
88	

5) Push(90):

- Push the element 90 onto the Stack.

Stack after Push

90	← TOP
66	
88	

6, Push (36):

- Push the element 36 onto the stack.

Stack after Push:

36	← TOP
90	
66	
88	

7, Push (11):

- Push the element 11 onto the stack.

Stack after Push:

11	← TOP
36	
90	
66	
88	

8, Push (88):

- Push the element 88 onto the stack.

Stack after Push:

88	← TOP
11	
36	
90	
66	

8. Pop():

• Remove the top element (88).

Stack after Pop:

9. Pop():

• Remove the top element (11).

Stack after Pop:

Final Stack State

Size of Stack: 5

Elements in stack (from bottom to top):

36, 90, 66

Top of Stack: 66

- ② Develop an algorithm to detect duplicate elements in an unsorted array using linear search. Determine the time complexity and discuss how you would optimize this process.

Algorithm

1. Initialization:

Create an empty set or list to keep track of elements that have already been seen.

2. Linear Search:

Iterate through each element of the array:

- For each element, check if it is already in the set of seen elements.
- If it is, a duplicate has been found.
- If it is found, add it to the set of seen elements.

3. Output:

Return the list of duplicates, or simply indicate that duplicates exist.

C code :-

```
#include <stdio.h>
#include <stdbool.h>

int main ()
{
    int arr[] = {4, 5, 6, 7, 8, 5, 4, 9, 0};
    int size = sizeof(arr) / sizeof(arr[0]);
```

```

bool seen[1000] = {false};
for (int i = 0; i < size; i++)
    if (seen[arr[i]])
        printf("Duplicate found: %d\n", arr[i]);
    else
        seen[arr[i]] = true;
return 0;
}

```

Time Complexity

The Linear search complexity:-

The time complexity for this algorithm is $O(n)$, where 'n' is the number of elements in the array. This is because each element is checked only once, and operations (checking for membership and adding to a set) are $O(1)$ on the average.

Space Complexity

The space complexity is $O(n)$ due to the additional space used by the 'seen' and 'duplicates' sets, which may store up to 'n' elements in the worst case.

Optimization

• Hashing:

The use of a set for checking duplicates is already efficient because sets provide average $O(1)$ time complexity for membership tests and insertions.

• Sorting:

If we are allowed to modify the array, another approach is to sort the array first and then perform a linear scan to find duplicates.

Sorting would take $O(n \log n)$ time, and the subsequent scan would take $O(n)$ time. This approach uses less space ($O(1)$ additional space if sorting in-place).
